

# C - Basics, Bitwise Operator

Zhaoguo Wang

Java is the best language!!!

NO! C is the best!!!!

# Languages

## **C**

1972

Procedure

Compiled to machine code, runs on bare machine

static type

Manual memory management

## **Java**

1995

Object oriented

Compiled to bytecodes, runs by another piece of software

static type

Automatic memory management with GC

## **Python**

2000 (2.0)

Procedure & object oriented

Scripting language, interpreted by software

dynamic type

# "Hello World"

```
1 #include <stdio.h>
2
3 int main()
4 {
5     printf("hello, world\n");
6     return 0;
7 }
```

# "Hello World"

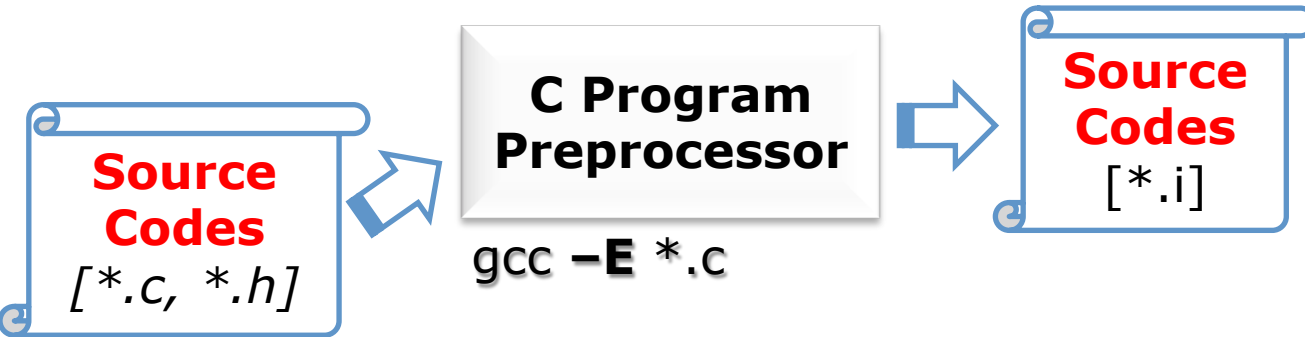

```
1 #include <stdio.h> ← Header file
2
3 int main()
4 {
5     printf("hello, world\n");
6     return 0;
7 }
```

Standard Library

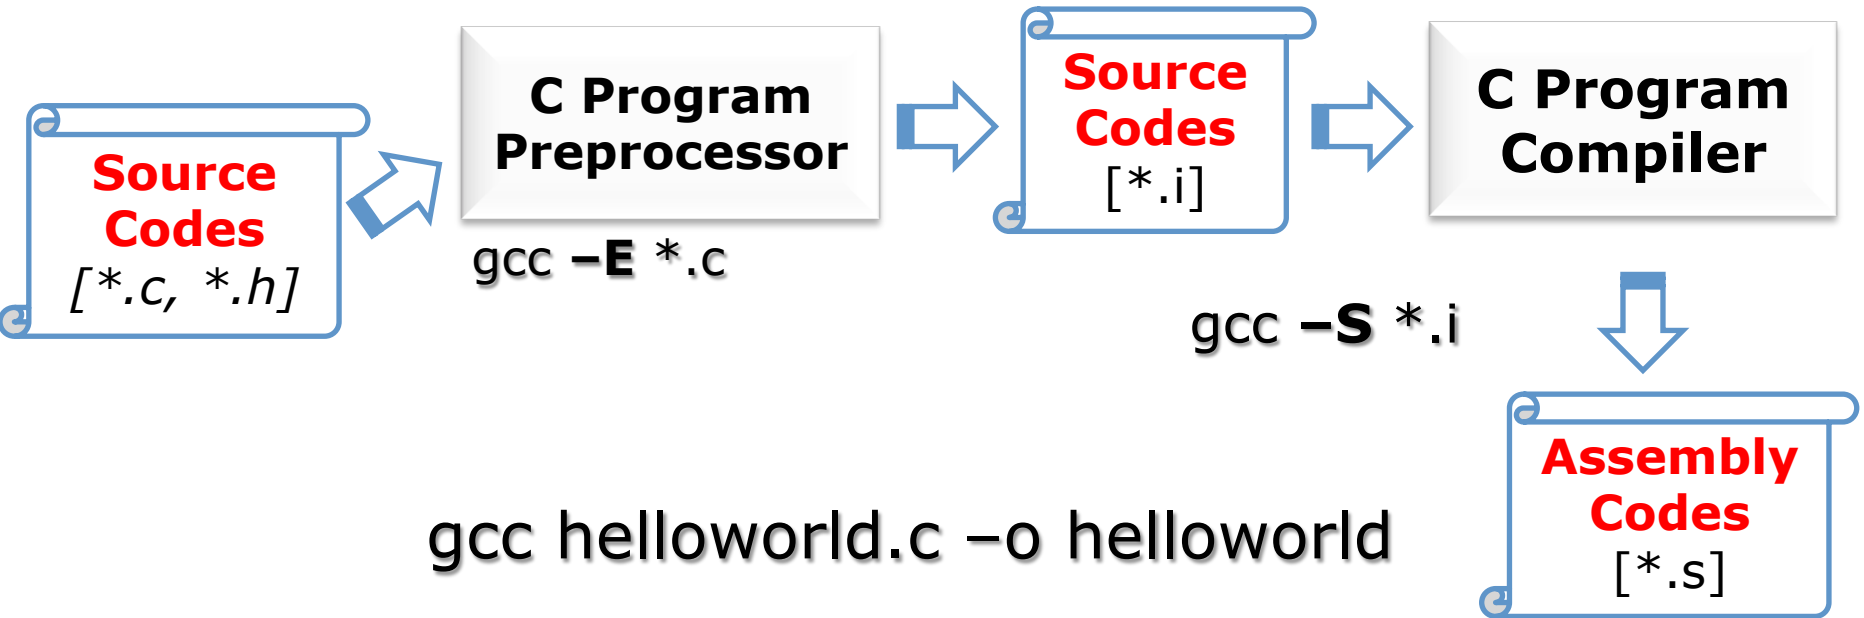

```
gcc helloworld.c -o helloworld
```

# Compiling

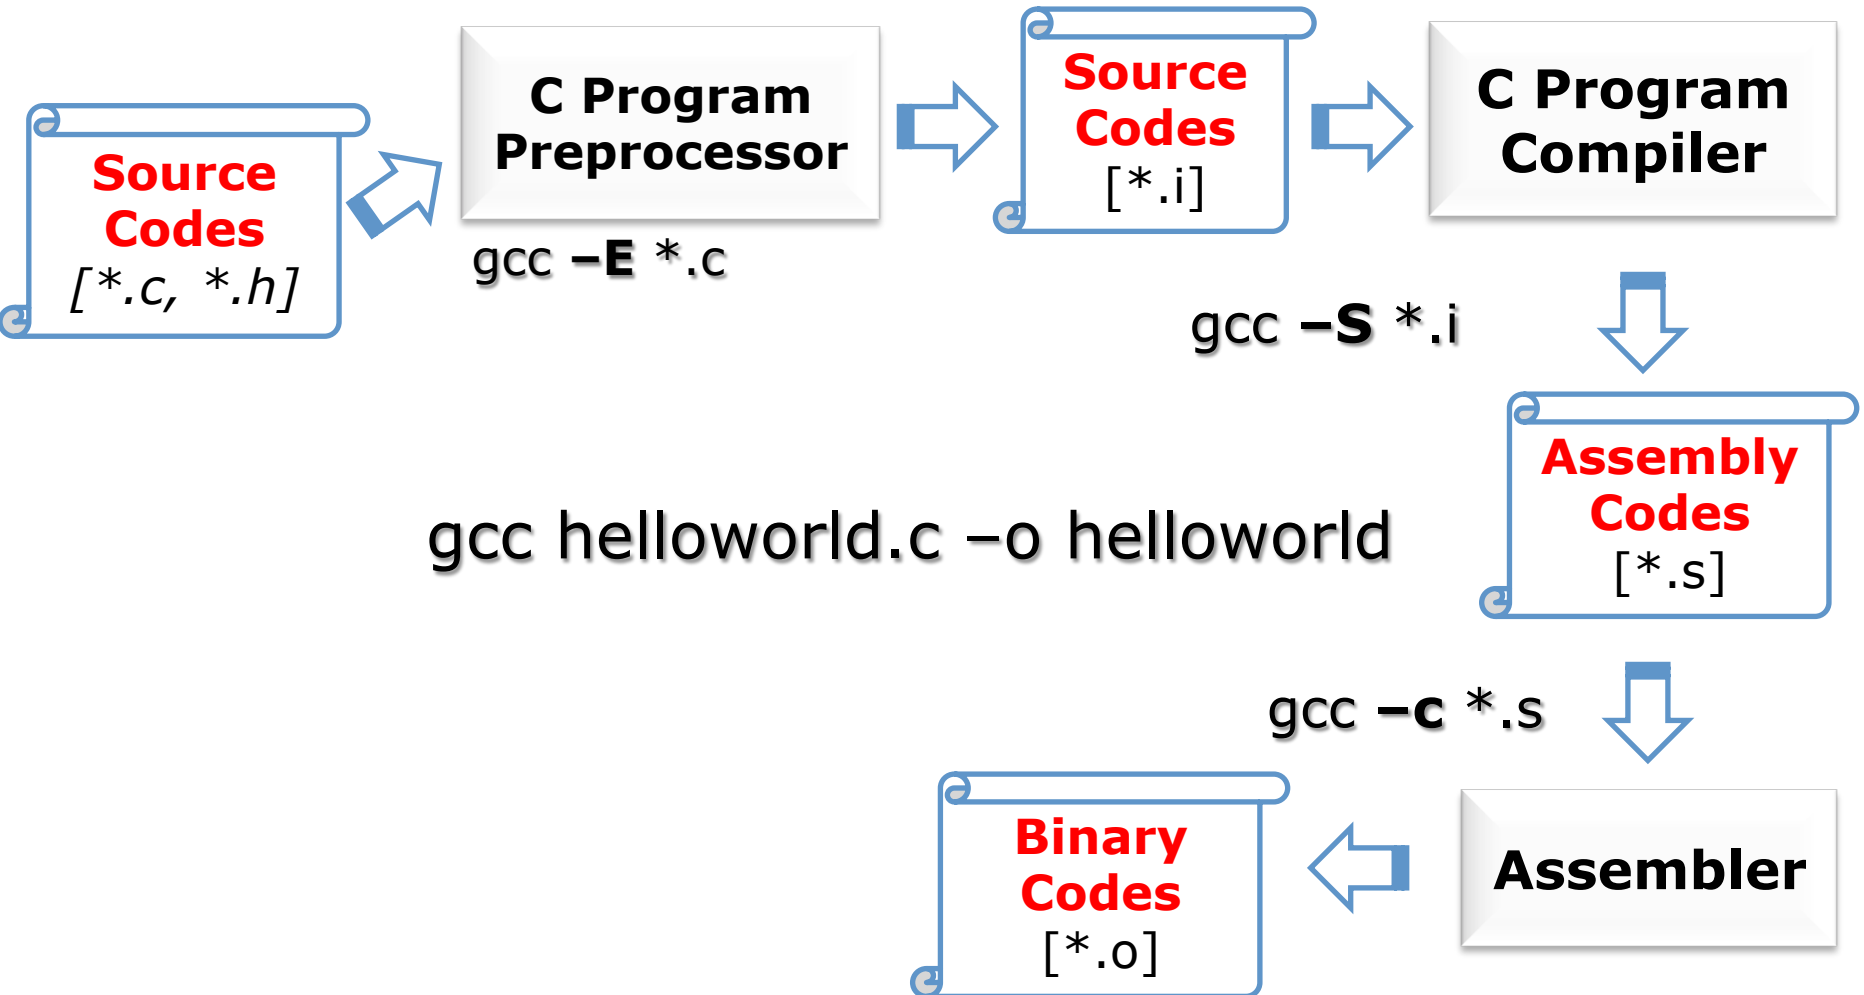

```
gcc helloworld.c -o helloworld
```

# Compiling

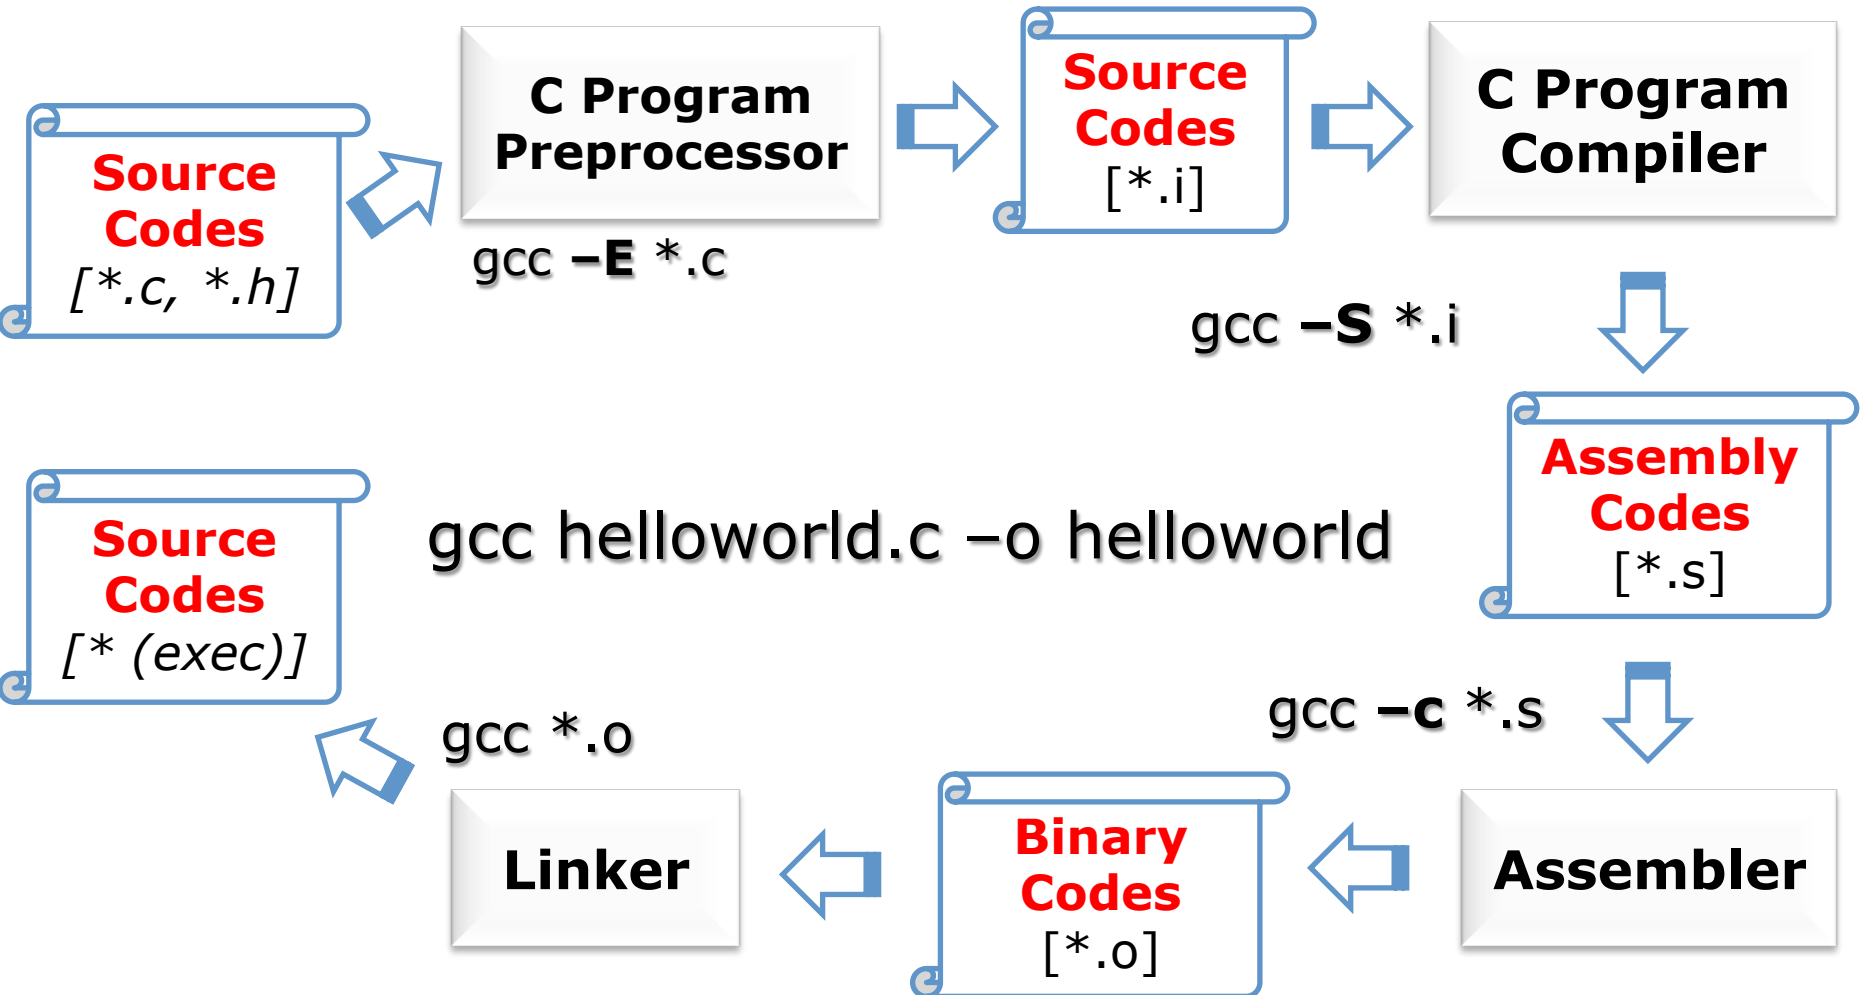

# Compiling

# Compiling

# Three basic elements

## Variables

- The basic data objects manipulated in a program

## Operator

- What is to be done to them

## Expressions

- Combine the variables and constants to produce new values

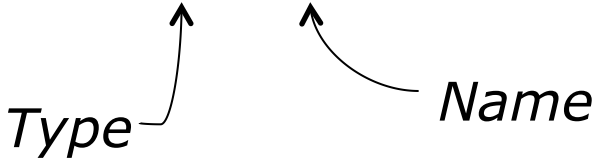

# Variables

Declaration: `int a = 1;`

The diagram illustrates the components of the variable declaration `int a = 1;`. Three arrows point from labels to the corresponding parts of the code: an arrow from *Type* points to `int`, an arrow from *Name* points to `a`, and an arrow from *Initial value* points to `1`.

# Variables

Declaration: `int a;`

*Type* → `int`      `a` → *Name* ;

Initial value later: `a = 0;`

# Primitive Types

type	size (bytes)	example
(unsigned) char	1	char c = 'a'
(unsigned) short	2	short s = 12
(unsigned) int	4	int i = 1
(unsigned) long	8	long l = 1
float	4	float f = 1.0
double	8	double d = 1.0
pointer	8	int *x = &i

64 bits machine

# Implicit conversion

```
int main()
{
    int a = 0;
    unsigned int b = 1;

    if (a < b) {
        printf("%d is smaller than %d\n", a, b);
    } else if (a > b) {
        printf("%d is larger than %d\n", a, b);
    }

    return 0;
}
```

# Implicit conversion

```
int main()
{
    int a = -1;
    unsigned int b = 1;

    if (a < b) {
        printf("%d is smaller than %d\n", a, b);
    } else if (a > b) {
        printf("%d is larger than %d\n", a, b);
    }

    return 0;
}
```

-1 is promoted to unsigned int and thus appears to be a large positive number.  $(4294967295)_{10}$

# Explicit conversion

```
int main()
{
    int a = -1;
    unsigned int b = 1;

    if (a < (int) b) {
        printf("%d is smaller than %d\n", a, b);
    } else if (a > (int) b) {
        printf("%d is larger than %d\n", a, b);
    }

    return 0;
}
```

(type-name) expression

# Operators

Arithmetic

`+, -, *, /, %, ++, --`

Relational

`==, !=, >, <, >=, <=`

Logical

`&&, ||, !`

Bitwise

`&, |, ^, ~, >>, <<`

Arithmetic, Relational and Logical operators are identical to java's

# Bitwise operator &

## And (&)

- given two bits  $x$  and  $y$ ,  $x \& y = 1$  when both  $x = 1$  and  $y = 1$

		x	
	&	0	1
y	0	0	0
	1	0	1

# Bitwise operator <<

Left shift ( "<<")

- $x \ll y$ , shift bit-vector  $x$  left  $y$  positions
  - Throw away extra bits on left
  - Fill with 0's on right

x                    0 1 1 0 1 0 0 1

x << 3

# Bitwise operator <<

Left shift ( "<<")

- $x \ll y$ , shift bit-vector  $x$  left  $y$  positions
  - Throw away extra bits on left
  - Fill with 0's on right

x	0	1	1	0	1	0	0	1
x << 3	0	1	0	0	1	0	0	0

# Bitwise operator >>

Right shift ( ">>")

- $x \gg y$ , shift bit-vector  $x$  right  $y$  positions
  - Throw away extra bits on right
  - Fill with ??? on left
    - Logical shifting
    - Arithmetic shifting

# Bitwise operator >>

## Right shift ( ">>" )

- $x \gg y$ , shift bit-vector  $x$  right  $y$  positions
  - Throw away extra bits on right
- Logical shift
  - Fill with 0's on left

	x	1 0 1 0 1 0 0 1
Logical	$x \gg 3$	0 0 0 1 0 1 0 1

# Bitwise operator >>

## Right shift ( ">>")

- $x \gg y$ , shift bit-vector  $x$  right  $y$  positions
  - Throw away extra bits on right
- Logical shift
  - Fill with 0's on left
- Arithmetic shift
  - Replicate most significant bit on the left

	x		1 0 1 0 1 0 0 1
Logical	x >> 3		0 0 0 1 0 1 0 1
Arithmetic	x >> 3		1 1 1 1 0 1 0 1

# Bitwise operator >>

## Right shift ( ">>")

- $x \gg y$ , shift bit-vector  $x$  right  $y$  positions
  - Throw away extra bits on right
- Logical shift (**shr**)
  - Fill with 0's on left
- Arithmetic shift (**sar**)
  - Replicate most significant bit on the left

	x		1 0 1 0 1 0 0 1
Logical	x >> 3		0 0 0 1 0 1 0 1
Arithmetic	x >> 3		1 1 1 1 0 1 0 1

# Which operation is used in C?

Arithmetic shifting on signed number, logical shifting on unsigned number

```
#include <stdio.h>
int main()
{
    int a = 1;
    unsigned int b = 1;
    printf("%d  %d\n", a>>10, b>>10);
}
```

# Logical shift on signed number

```
int lsr(int x, int n)
{
    ???
}
```

# Logical shift on signed number

## Observation

- It do the logical shift on unsigned number

## Solution

- Convert the signed type into unsigned

# Logical shift on signed number

```
int lsr(int x, int n)
{
    return (int)((unsigned int)x >> n);
}
```

# Control flow

```
int a = b + 1
```

*expression*

The diagram illustrates the control flow of the code. A horizontal line underlines the entire line of code 'int a = b + 1'. A curved arrow points from the word 'expression' below to the right-hand side of the assignment, 'b + 1', indicating that this part of the code is the expression being evaluated.

# Expression

Combine the variables and constants to produce new values

```
int a = b + 1
```

```
int c = ( d << 1 ) + 2
```

```
float f = (float) c
```

# Control flow

```
int a = b + 1;
```

 *statement*

# Control flow

```
{  
    int a = b + 1;  
    int c = a * 2;  
}
```

*block*

# Control flow

```
if (expression) {  
    int a = b + 1;  
    int c = a * 2;  
}
```

*control statement* 

# Control flow

```
if (expression)  
    statement1  
else  
    statement2
```

# Control flow

```
if (expression)  
    statement1  
else  
    statement2
```

```
if (expression1)  
    statement1  
else if (expression2)  
    statement2  
else  
    statement3
```

# Control flow

```
switch (expression) {  
    case const-expr1: statements1  
    case const-expr2: statements2  
    default: statements3  
}
```

# Control flow

```
while (expression) {  
    statement  
}
```

# Control flow

```
while (expression) {  
    statement  
}
```

```
for(expr1; expr2; expr3) {  
    statement  
}
```

# Control flow

```
expr1;  
while(expr2) {  
    statement  
    expr3;  
}
```

```
for(expr1; expr2; expr3) {  
    statement  
}
```

# Control flow

## Break

- cause the innermost enclosing loop or switch to be exited immediately

## Continue

- cause the next iteration of the enclosing *for*, *while*, or *do* loop to begin.

# Control flow

`goto label`

- Usable C provides the infinitely-abusable *goto* statement, and labels to branch to.
- Abandon processing in some deeply nested structure.

```
for(...) {  
    for(...) {  
        for(...) {  
            goto error  
        }  
    }  
}
```

***error:***

clean up the mess
